TI - Laser printer connected to network - transfers printing environment
    information such as current printing setting conditions, present mode of
    operation and cache data, to external memory
AB - J10143340 The printer includes an external memory (14), such as hard disk.
    A receiver receives the printing request from hosts (15) in the network.
    While executing the request of one host, if the process is interrupted to
    carry out the printing request of another host, a transfer unit transfers
    printing environment information such as current printing setting
    conditions, present mode of operation and cache data, to the external
    memory.
    - ADVANTAGE - Restarts interrupted printing process, after executing
    printing request that interrupted.
    - (Dwg.3/6)

===== PAJ =====
TI - PRINTER
AB - PROBLEM TO BE SOLVED: To resume print processing, which has been
    temporally suspended, in a print environment before suspension after
    interruption print processing is finished even when the print processing
    is temporally suspended by an interruption print request of another host
    during the time when the print processing of print data from one host is
    performed.
    - SOLUTION: When an interruption print request comes form another host
    during print processing of print data from one host on a network, the
    current print setting conditions, an operation mode and information that
    shows each print environment of cache data are saved in a disk drive
    (external storage device), information that shows print environment from
    a host that makes an interruption print request is read with that state,
    after the print processing of print data from the host is carried out
    according to the information, the information showing the print
    environment which is saved in the disk drive is called out and the print
    processing, which has been temporally suspended, is resumed.
